

The ATC330 device

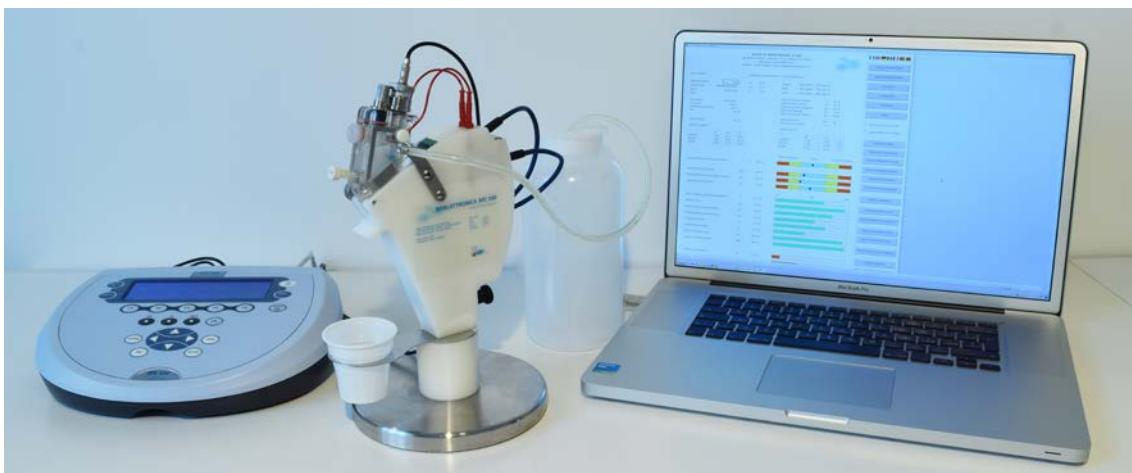

The ATC330 system is inspired by Vincent's Bioelectronics, a science born in 1950 from the French engineer L.C. Vincent to determine the quality of the "Cellular Terrain", through the measurement of 3 parameters (pH, Redox and electrical conductivity) on the main body fluids (blood, saliva and urine).

The original Bioelectronics of Vincent, has often been at the center of interesting studies, but at the same time has suffered from considerable problems of stability of the measuring electrodes and the interpretation of results.

The method was then picked up by Giovanni Righetti, an expert electro technical who since 1997 has worked on the development of the method by executing thousands of measurements, with an international Team of doctors, physicists and engineers.

ATC330, recently developed and reformulated by engineer Mattia Zambetti according to technological developments and the experience accumulated over the years of working with physicians and technicians, is now very precise and innovative in analysis, proposing as a radical evolution of Bioelectronics of Vincent.

With a totally new formulation, new algorithms and measurement system, the ATC330 device has now a very high precision and reliability in the measured parameters and it is equipped with a new software for automatic analysis and an easy interpretation of the data providing a complete layout of the Cellular Terrain and highlighting potential unbalances which may compromise the individual's health.

The ATC330 device, ready to measure

The ATC330 main concept

The purpose of ATC330 analysis is to determine, through the analysis of electrochemical characteristics of the principal fluids of the human body, the health condition of the "Cellular Terrain", - i.e. the environment in which cells are plunged - , based on principle that the balance of cell viability is regulated by biological electromagnetic variations.

The well-being of this "Terrain" influences the health of the cells which live into it and therefore the health and well-being of the individual.

Cells live and breathe exchanging nutrients with the environment in which they live.

If this environment is clean and energetically balanced, the cells will benefit a proper supply of nutrients, good vitality, remarkable capacity to regenerate and heal by themselves.

On the contrary, if the environment is imbalanced, oxidized, electrochemically imbalanced and charged with toxins, it will entail a progressive weakening of the cells and even chronic disorders and dysfunctions at a greater or lesser extent.

This technique is very easy and fast but at the same time extremely reliable. Bioelectronic ATC330 can be positioned in the wellness and preclinical medicine areas.

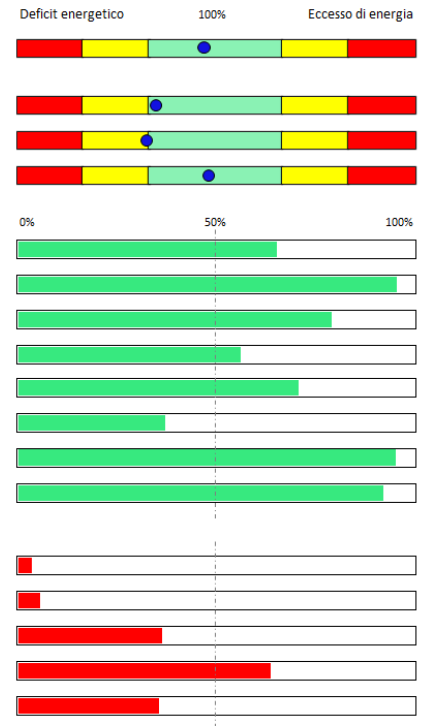

Compared with other known diagnostic systems, ATC330 represents an important joining link between the clinic-pathological medical approach and the energetic one: in fact the device is able to scientifically measure the energetic balances of the organism, never examined in other ways, allowing a deeper analysis of the root cause of many troubles and problems.

To this day the ATC330 system is the only device capable of providing an objective evaluation (following the criteria of scientific nature and reproducibility according to the traditional standards) of energetic perspectives, more and more appreciated by final consumers, allowing to determine whether a specific vulnerability exists or whether a tendency towards particular unbalances is present.

Cellular Terrain analysis

In particular, the Cellular Terrain Analysis with ATC330 allows to determine and balance:

- The vitality of the organism from which the immune response and feeling of chronic weariness depend.
- The reactive capacity of the subject on an overall level, at the level of nutrient absorption and at the level of toxin draining, to maintain the organism constantly efficient.
- The energetic activity of the main organs and body cavities, like the energy of mitochondria, at the basis of the processes of aerobic breathing and crucial for the prevention of degenerative pathologies.
- The energy of organs like kidneys, liver, intestine, pancreas, cardiovascular and nervous system, bones whose vitality and synergy are crucial for the body metabolisms and the patient's well-being
- The indexes of emotional stress, electrosmog stress, at the basis of a slow yet progressive attrition of the organism.
- The acidosis index, from which inflammations depend.
- The oxidative stress, from which allergies and general illnesses depend.
- The diathesis framing according to Menetrier, to determine the tendency towards which the cellular Terrain is moving, providing useful suggestions in terms of integrations to rebalance the organism.
- The cellular harmony chart, related to the synergy among the organelles within the cell and the intracellular energetic balances.
- The evolution of troubles and problems due to a progressive pollution of the cellular Terrain, providing useful indication on how to restore the cellular homeostasis.
- The action of certain medicaments, drugs, supplements or food on the organism.

Determination of food vital energy

It can be said, synthetically, that among the diverse existing forms of energy, vital energy represents a specific energy in line with the cellular biochemistry of living forms, and allows the cells to grow and settle correctly.

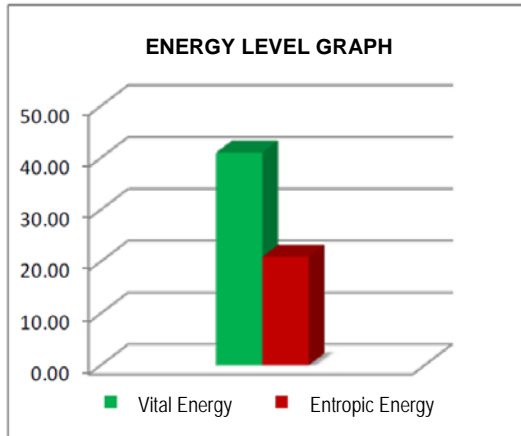

So, if the Terrain analysis with Bioelectronics ATC330 allows the evaluation of human energetic balances, in order to attain a precise and efficient rebalance, it would be needed to know the quality and energy of the water, food and supplements assumed, to control its possible use as a specific food supplement useful to the rebalancing of the subject.

Each liquid possesses, according to Ohm's laws, a certain energetic quantity in μW , starting with the values of tension and resistance, scientifically measurable.

From the total value of μW of a solution, the objective of ATC330 analysis is to determine the quota of vital energy, from a strictly energetic point of view, that is to say that quota which may effectively provide useful energy to the human cell.

In particular ATC330 vital energy software allows to calculate:

- The quota of vital energy in the analyzed food
- The resonance index, i.e the food bioavailability with the human organism

Generally foods with high vital energy and high resonance index will be preferred.
